

@

F. Le Diberder  
on behalf of the  
LAL-IPHC team

The present proposal is :

**for LAL-IPHC to join Belle-II as a long term commitment**

It covers mostly **the initial period 2017-2018-2019** of the ramping up of the activities. We expect the team to enlarge and expand its responsibilities later (no commitment yet).

The proposal concerns **only Belle-II**, although it should be put in context, and thus other activities not belonging to the present Belle-II proposal will be mentioned.

The understanding should be that the commitment of LAL-IPHC is meant for the full Belle-II project (far beyond 2019) and should represent quickly the main activity of the members of the team.

Scientific Council LAL : 22 May

Scientific Council IPHC : 8 June

Belle-II Institutional Board : 19 June

enthusiastically

**SuperKEKB**

$$e^{-} (7\text{GeV}) \xrightarrow[\Upsilon(4S)]{83 \text{ mrad}} e^{+} (4\text{GeV})$$

# Luminosity trend

# How to increase the luminosity?

$$L = \frac{\gamma_{e^\pm}}{2er_e} \left( 1 + \frac{\sigma_y^*}{\sigma_x^*} \right) \left( \frac{I_{e^\pm} \xi_y^{e^\pm}}{\beta_y^*} \right) \left( \frac{R_L}{R_{\xi_y}} \right)$$

Lorentz factor  $\rightarrow \gamma_{e^\pm}$   
 Beam current  $\rightarrow I_{e^\pm}$   
 Beam-beam parameter  $\rightarrow \xi_y^{e^\pm}$   
 Classical electron radius  $\rightarrow r_e$   
 Beam size ratio@IP  $\rightarrow \frac{\sigma_y^*}{\sigma_x^*}$  (flat beam)  
 Vertical beta function@IP  $\rightarrow \beta_y^*$   
 Lumi. reduction factor (crossing angle) & Tune shift reduction factor (hour glass effect)  $\rightarrow \frac{R_L}{R_{\xi_y}}$   
 0.8 - 1 (short bunch)

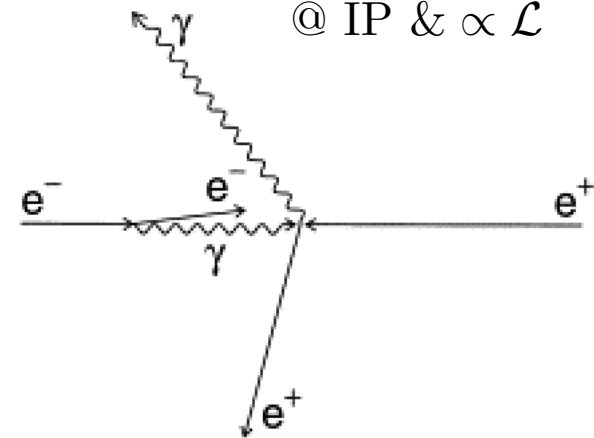

- "Nano-Beam" scheme**
- (1) Smaller  $\beta_y^*$
  - (2) Increase beam currents
  - (3) Increase  $\xi_y$

Collision with very small spot-size beams  
cf. Pantaleo Raimondi (SuperB)

# Machine Design Parameters

parameters		KEKB		SuperKEKB		units
		LER	HER	LER	HER	
Beam energy	$E_b$	3.5	8	4	7.007	GeV
Half crossing angle	$\phi$	11		41.5		mrad
# of Bunches	N	1584		2500		
Horizontal emittance	$\epsilon_x$	18	24	3.2	4.6	nm
Emittance ratio	$\kappa$	0.88	0.66	0.27	0.28	%
Beta functions at IP	$\beta_x^*/\beta_y^*$	1200/5.9		32/0.27	25/0.30	mm

BT: tuning of the beam transport lines

First collision

collision tuning

# Belle II, a flavour-factory, a rich physics program ...

- We plan to collect  $50 \text{ ab}^{-1}$  of  $e^+ e^-$  collisions at (or close to) the  $Y(4S)$  resonance, so that we have:

– a **(Super) B-factory** ( $\sim 1.1 \times 10^9 \text{ B}\bar{\text{B}}$  pairs per  $\text{ab}^{-1}$ )

"on resonance" production

$$e^+ e^- \rightarrow Y(4S) \rightarrow B_d^0 \bar{B}_d^0, B^+ B^-$$

- 2 B's and nothing else !
- 2 B mesons are created simultaneously in a  $L=1$  coherent state

– a **(Super) charm factory** ( $\sim 1.3 \times 10^9 \text{ c}\bar{\text{c}}$  pairs per  $\text{ab}^{-1}$ )

– a **(Super)  $\tau$  factory** ( $\sim 1.3 \times 10^9 \text{ }\tau^+ \tau^-$  pairs per  $\text{ab}^{-1}$ )

– with Initial State Radiation, effectively scan the range  $[0.5 - 10] \text{ GeV}$  and measure the  $e^+ e^-$  light hadrons cross section very precisely

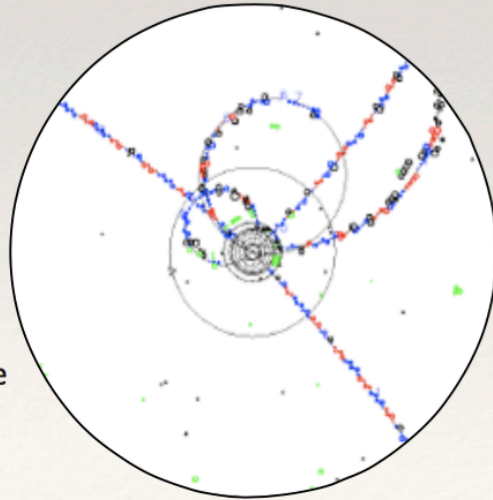

– exploit the clean  $e^+ e^-$  environment to probe the existence of exotic hadrons, dark photons/Higgs, light Dark Matter particles, ...

Belle-II relies on DIRAC

# Computing Model

>10 PB of raw data per year  
 → Distributed computing model  
 Share per fraction of PhDs

# Computing resources

## Belle II Computing : resource estimate (up to 2021 $\sim 20 \text{ ab}^{-1}$ )

Basically, each collaboration country is expected to provide the computing resources

proportional to a fraction of the number of Ph.D researchers in Belle II

Assuming 10 PhD researchers in French Belle II group,  $\sim 3\%$  contribution is expected.

An already long history  
of collaboration France-Japan  
notably for computing/software

(very friendly & open detailed discussions)

**23<sup>rd</sup> morning was added for further exchanges on software needs**

**commissioning**

# Conclusion

France very much welcome

## Summary of intended contributions (beside data analysis, and MDI follow-up)

At this stage Belle-II is gathering all its strenghts to assemble Detector&Software, which is a very exciting time in a collaboration lifetime.

France is **very much welcome**, and very much friendly expected to be a full-fledge member of the collaboration (kindergarten atmosphere).

For Belle-II, our acted commitments so far are :

ARICH

Tracking software ( $K_s^0$ )

**The synergy between both labs is genuine for analysis aspects but it turned out to be strong for all aspects.**

Other commitments are indiscussion, keeping in mind to avoid dispersion and over-commitments (re-inforcement would help a lot).

Request to IN2P3 Scientific Council:  
positive recommendation for

- The initiative : IN2P3 joins Belle-II (long term)
- The initial phase (2017-2019)
- The growth up to ~ 12 FTE

For the initial phase, the funding request are

- Travel missions for collaboration meetings (3/year)
- Long Stay of
  - L. B. : 1-2 months 2017 : 1-2 years 2018-2019
  - F. LD. : CNRS “delegation + MAD” (2 years) 2018-2020

**Answer to referees questions**

- **State of the art (Theory)**

$$\lambda_\gamma = \frac{|C'_7|^2 - |C_7|^2}{|C'_7|^2 + |C_7|^2} \simeq -1 + 2 \left| \frac{C'_7}{C_7} \right|^2 = -1 + 2 \left( \frac{m_s}{m_b} \right)^2 |\delta|^2 \simeq -1 + 10^{-3} |\delta|^2$$

Non-pQCD  $\delta_{K^*\gamma} \simeq 0.8(2)$

(guts feeling)  $\lambda_\gamma(\text{SM}) = -1$  at most at a few percents level

Answers to questions from referees

- **State of the art (Experiment)**

LHCb (2014)  $\lambda_\gamma \neq 0$  ( $5.2\sigma$ )

Towards the measurement of  $\lambda_\gamma$   
(as of now R&D level)

LHCb (2016) PhD (G. Veneziano)

Belle-I (ongoing analysis K. Trabelsi KEK)

Very challenging : **middle term** analysis project  
(because of background(s) and theory)

⇒ joint LHCb-Belle mini workshop fall 2017  
present experimental status

$$\begin{aligned}
 A_T^{(2)} &= -0.23 \pm 0.23 \pm 0.05 \\
 A_T^{\text{Im}} &= +0.14 \pm 0.22 \pm 0.05 \\
 S_{K_s \pi^0 \gamma} &= -0.16 \pm 0.22 \\
 \text{Br}_{B \rightarrow X_s \gamma} &= (3.43 \pm 0.22) \cdot 10^{-4} \\
 A^\Delta &= -0.98 \pm 0.54
 \end{aligned}$$

$|\lambda_\gamma| > 0.75$  (if next LHCb = SM)

5 dimensional kinematical variables

1 night on laptop?!

5 parameter fit

Statistics tricks  
play ground!

$$E = \begin{pmatrix} 0.034 & -0.133 & -0.021 & -0.067 & 0.007 \\ & 0.040 & 0.260 & 0.630 & -0.320 \\ & & 0.019 & 0.395 & -0.470 \\ & & & 0.680 & -0.405 \\ & & & & 0.180 \end{pmatrix}$$

Preliminary result!

- ← Photon polarization
- ← K1(1270)/K1(1270) separation
- ← (Kπ)<sub>s-wave</sub> contributions
- ← K1 mixing angle c.f. (60±10)°
- ← Damping factor c.f. (4±0.5)

At ~3% level sensitivity to all 5 parameters (5k events)!

- Fast fitting time -> many theoretical checks possible  
- This trick can be applied to many other places (LAL contribution to fit package)

E. Kou & F. Le Diberder  
on-going

Matrix Element Method

Some tricks are similar to the ones used for the measurement of the tau polarization at LEP

~ 2 ab<sup>-1</sup> ≈ 2020

k€

Typical stays and related cost : KEK = 7 days \* 3 = 6k€ + IPHC-LAL = 1 day \* 2 = 1k€

- No double counting with MDI.
- **Long stay not accounted for** (1-2 months 2017, then full year 2018-2019)

# Belle-II versus LHCb : why Belle-II ?

## Institution level reason:

- 1) IN2P3-HEP is strongly present in LHC, in fact only in LHC => diversification
- 2) Develop collaboration with Japan
- 3) Funding needs are limited : small group, M&O very low

## Physics reason:

- 1) Two extremely different experiments  
LHCb strengths : huge statistics, boost, all B's produced, detector tuned  
Belle-II strengths : large statistics, boost, very clean events, new detector  
exquisite tagging and  $\pi_0$  , backgrounds much smaller, and of different nature
- 2) If New Physics is observed in any of the two experiment  
=> confirmation by the other is essential (would be delighted to simply confirm)

## Sociological reason:

- 1) (non-aggressive) competition is a plus for the scientific life of an Institute (ATLASCMS)
- 2) Longstanding ties with KEK (and Japan) for most members of the LAL-IPHC team
- 3) Belle-II group is not meant to grow large : no threat on LHCb
- 4) LAL-LHCb welcome the initiative

**Remarks : cf. strong European presence in Belle-II (France is a late comer)**

## Beyond Initial period (2017-2019)

The goal is to expand the group from  $\sim 4$  FTE (2019) to  $\sim 12$  FTE (permanent staff) and to attract other laboratories in France.

The present proposal to the CS-IN2P3 concerns only the initial phase because of that:

We are a small team, with no concrete proposition to future detector realization, yet.

The detector being assembled, the Belle-II collaboration is not diverting efforts to possible upgrades. Only for DAQ, an upgrade appears necessary in the middle term, but even here, the **kick-off** workshop on the subject will be held only in Fall 2017.

Would “significant” propositions from us materialize, the implication of the Institute would imply an explicit formulation to, and approval by the Scientific Council(s).

Remark : Considering the future size of the group (<- not “large”) the term “significant” is to be understood “considering the size of the group”.
